

# JAVASCRIPT DEVELOPMENT

*Sasha Vodnik, Instructor*

# HELLO!

1. Pull changes from the `svodnik/JS-SF-8-resources` repo to your computer
2. Open the `starter-code` folder in your code editor

---

**JAVASCRIPT DEVELOPMENT**

---

# **DEPLOYING YOUR APP**

# **LEARNING OBJECTIVES**

At the end of this class, you will be able to

- › Understand what hosting is.
- › Identify a program's needs in terms of host providers.
- › Ensure backward compatibility by using Babel to transpile code.
- › Deploy to a web host.

# AGENDA

- Update with Firebase
- Delete with Firebase
- Convert code to a module
- Transpile with Babel
- Deploy with Firebase

---

## DEPLOYING YOUR APP

---

# WEEKLY OVERVIEW

**WEEK 9**

CRUD & Firebase / Deploying your app

**WEEK 10**

React / Final project lab

**WEEK 11**

Final project presentations

## **EXIT TICKET QUESTIONS**

1. This goes back a couple lessons but I hear "That's an ajax call" at work all the time. I'm wondering how that is different from an get request to an API and when to use them.
2. Can you just keep reinforcing closures and module patterns and why we would use them?
3. How the upvote/downvote functionality will be added.

# LAB — IMPLEMENT UPDATE FUNCTIONALITY

---

## KEY OBJECTIVE

---

- › Build the Update functionality of a full-stack app

## TYPE OF EXERCISE

---

- › Solo or in pairs

## TIMING

---

*10 min*

1. Examine the API documentation at
  - › <https://firebase.google.com/docs/reference/js/firebase.database.Reference#update>
  - › <https://firebase.google.com/docs/reference/js/firebase.database.Reference#set>
2. Create a function to make updates to the database
3. Add calls to your new function when data is changed in your app

# LAB — IMPLEMENT DELETE FUNCTIONALITY

---

## **KEY OBJECTIVE**

---

- Build the Delete functionality of a full-stack app

## **TYPE OF EXERCISE**

---

- Solo or in pairs

## **TIMING**

---

*5 min*

1. Examine the API documentation at <https://firebase.google.com/docs/reference/js/firebase.database.Reference#remove>
2. Create a function to delete records from the database
3. Add calls to your new function when data is deleted in your app

## **CREATING A MODULE**

- Group variables and functions within an IIFE
- Export an object from the IIFE containing properties and/or methods that are aliases for variables and/or functions within the IIFE
- Change any references to the variables and functions outside of the IIFE to use object notation

---

**LET'S TAKE A CLOSER LOOK**

---

---

# EXERCISE — CONVERT CODE TO A MODULE

---

## **KEY OBJECTIVE**

---

- ▶ Convert the code for your CRUD app to use the module pattern

## **TYPE OF EXERCISE**

---

- ▶ Solo or in pairs

## **TIMING**

---

*5 min*

1. In your completed code from Monday (or the start files for today folder 1-module), open `app.js` in your editor
2. Create a new variable called `messageClass`. Its value should be an IIFE that contains the code for the `getPosts()`, `updateMessage()`, and `deleteMessage()` functions, and returns an object containing a method that provides access to the `getPosts()` function.
3. In the `$(document).ready()` code, change the `getPosts()` call to instead call the new method you created.
4. Test your app and make sure all its functionality still works.

---

**DEPLOYING YOUR RAPP**

---

# **TRANSPILING WITH BABEL**

virtually all browsers  
in use support ES5

only modern browsers  
support ES6+

**Transpiling** involves rewriting code that uses ES6+ features to produce the same result using ES5 code

ES6

```
const taxRate = 0.0875;
let items = [];

let addToCart = () => {
  // do something
}
```

transpiling

ES5

```
var taxRate = 0.0875;
var items = [];

function addToCart() {
  // do something
}
```

---

**LET'S TAKE A CLOSER LOOK**

---

---

## EXERCISE — TRANSPILE CODE USING BABEL

---

EXERCISE

### KEY OBJECTIVE

---

- › Ensure backward compatibility by using Babel to transpile code.

### TIMING

---

*5 min*

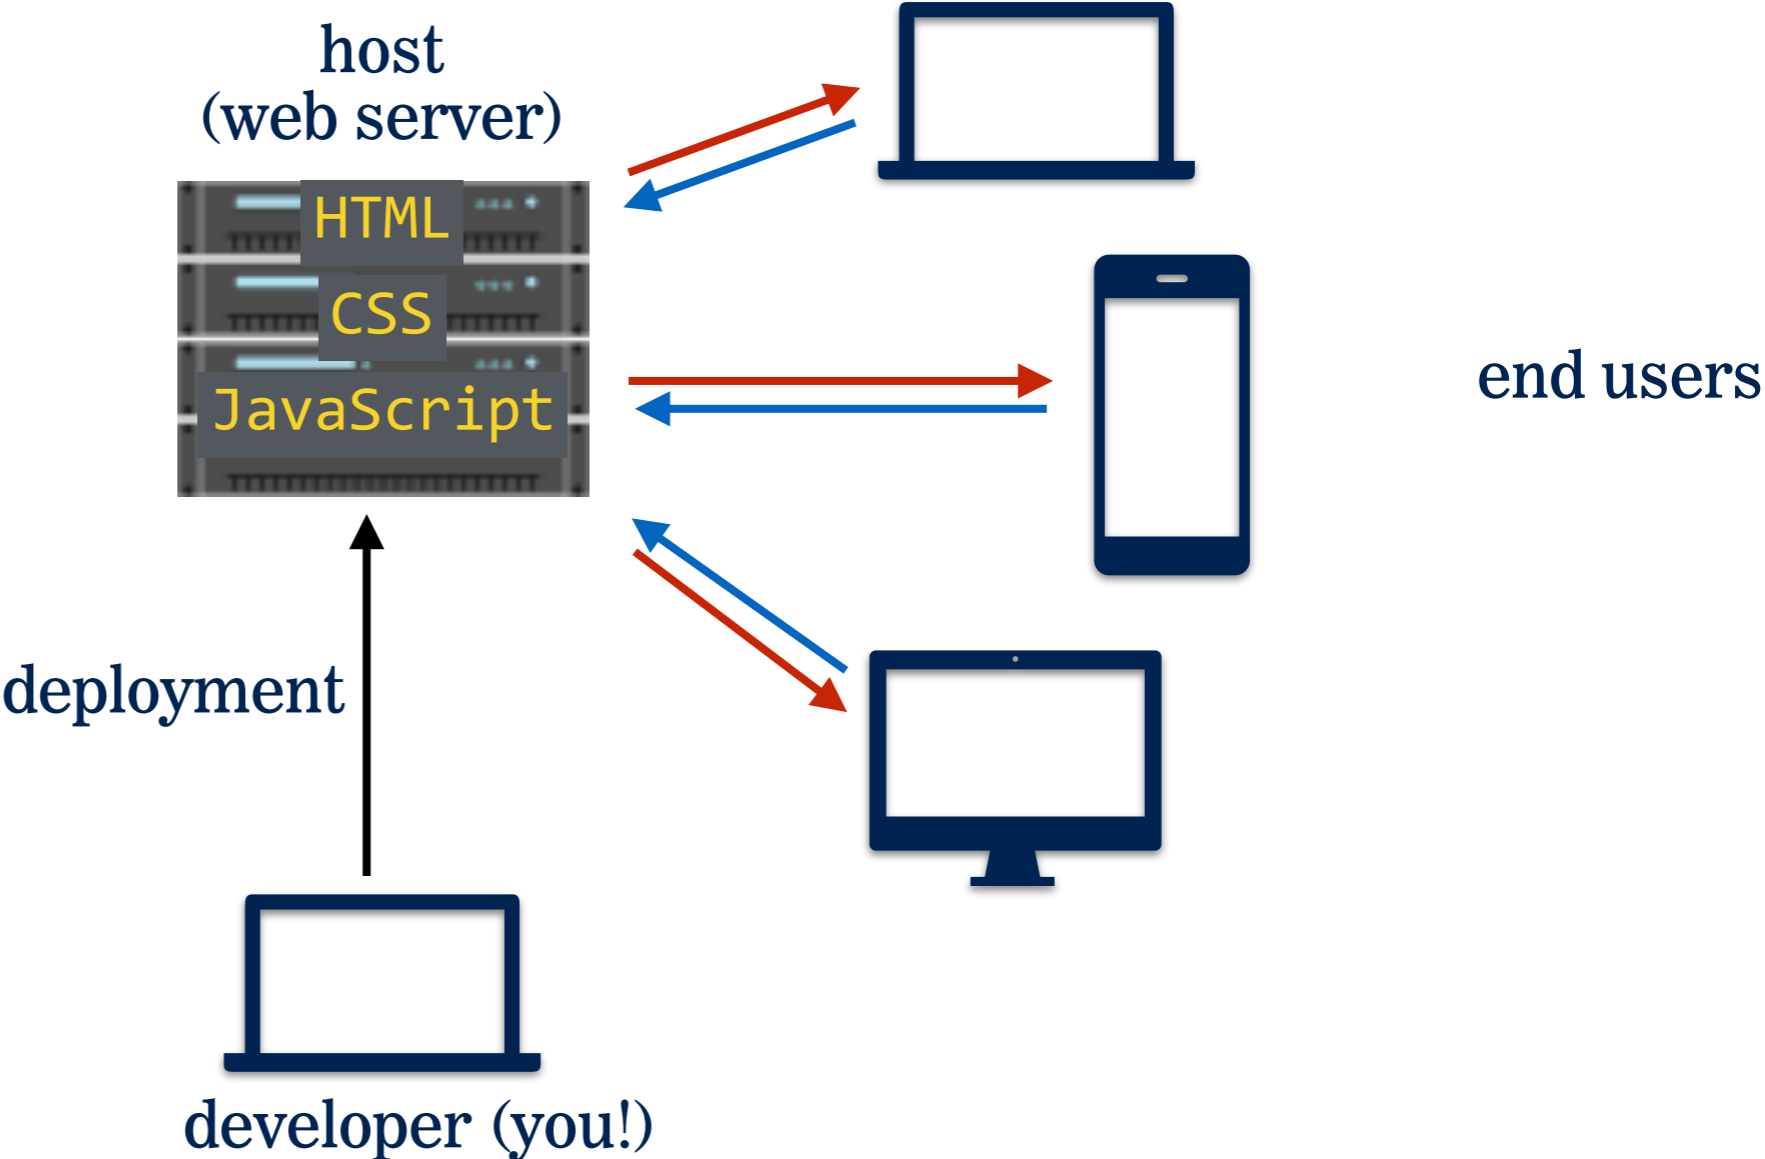

1. Configure Babel for the app you created in class. (If your code isn't quite working, use the code in the `starter-code > 5-transpiling-exercise` folder as a starting point.)
2. Run Babel to create an ES5-compatible version of your code.
3. Open the converted file in your editor and verify the code was transpiled.
4. Test your app in the browser and make sure it still works as it did previously.

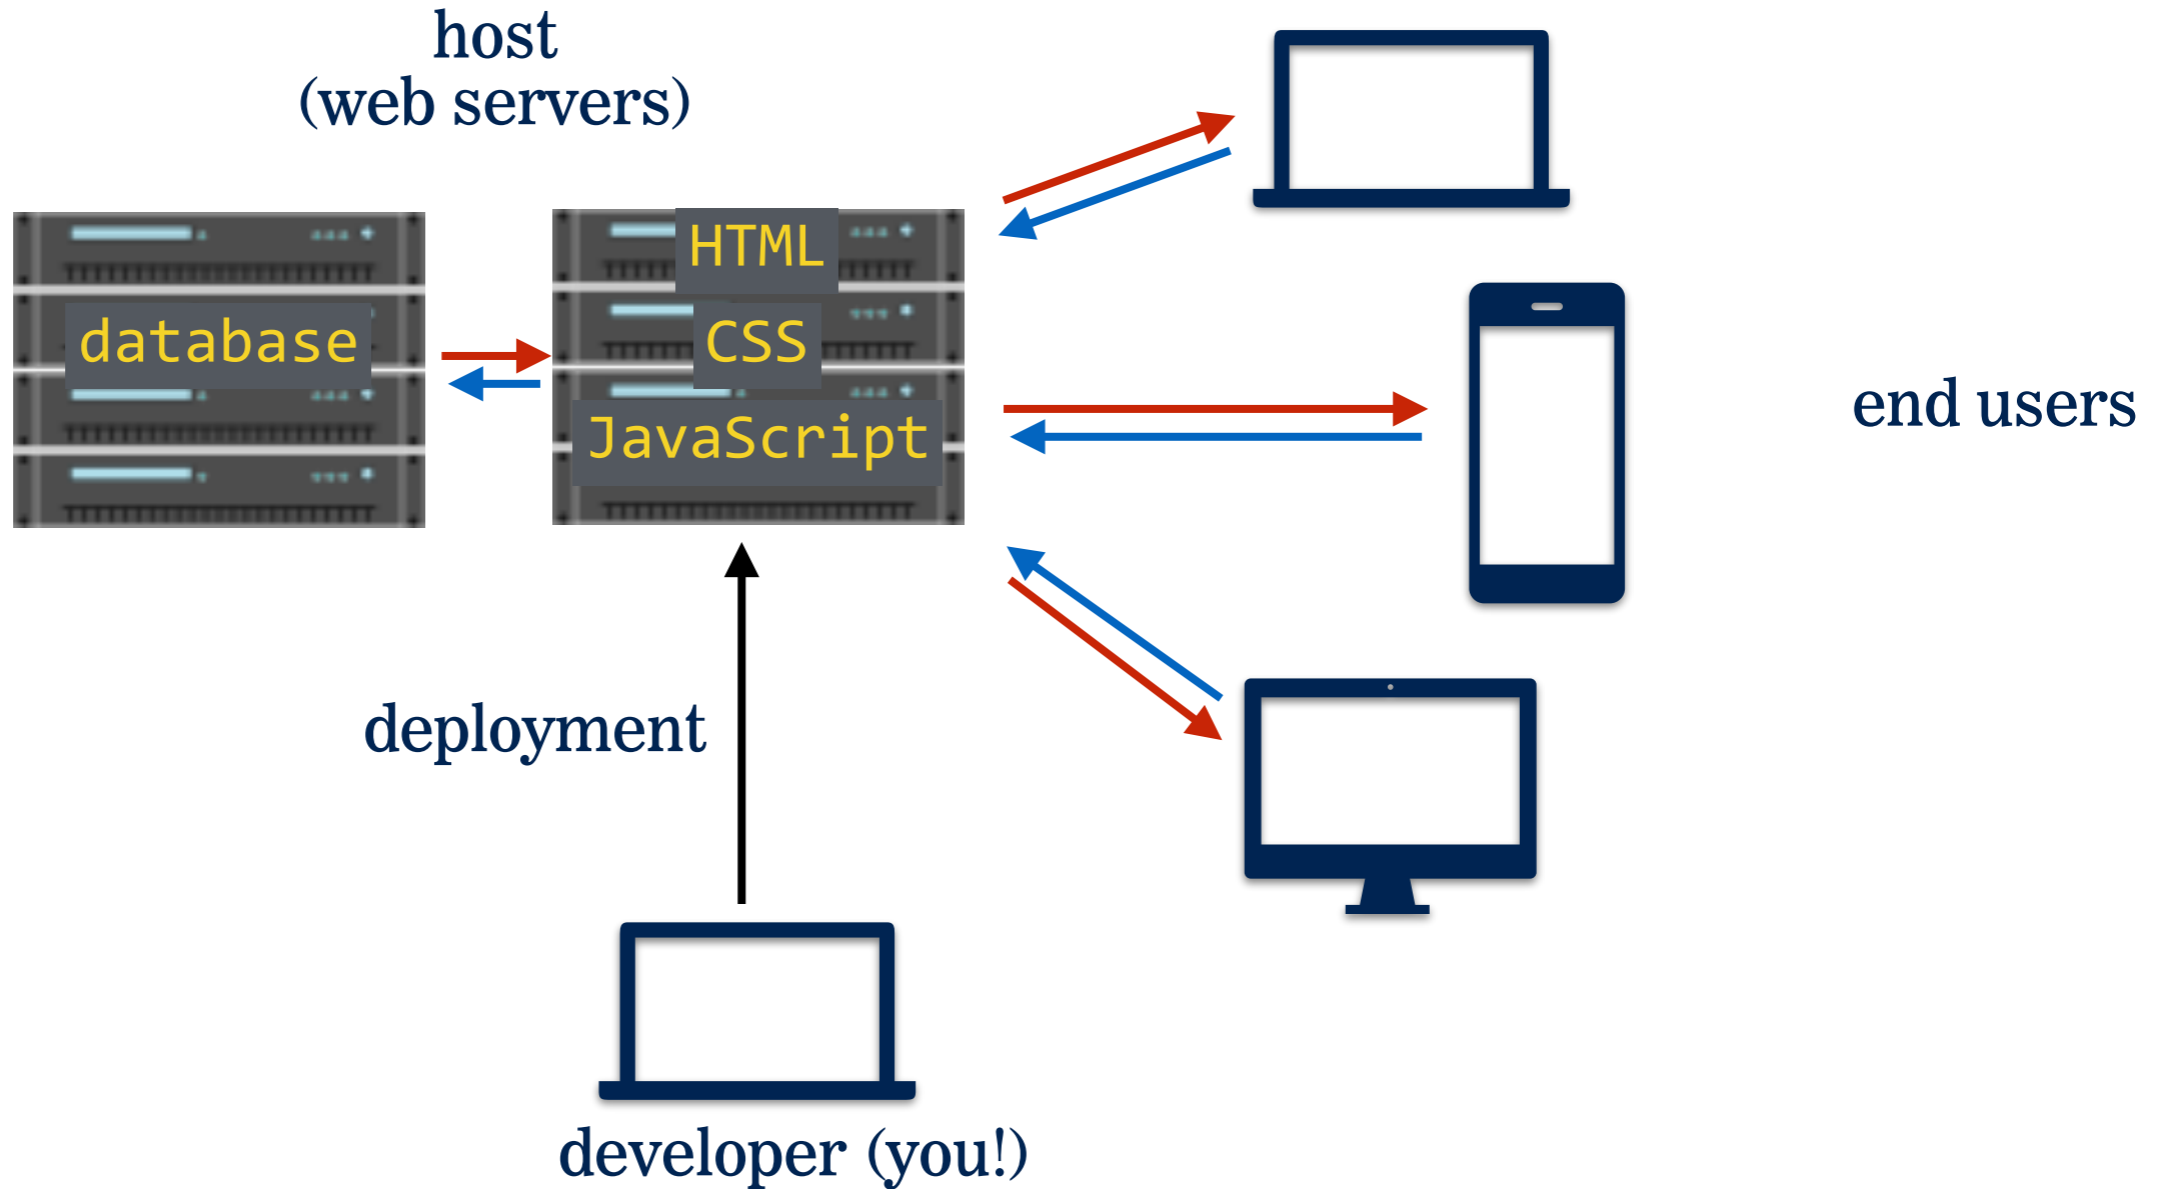

---

**DEPLOYING YOUR APP**

---

# **DEPLOYMENT**

---

**LET'S TAKE A CLOSER LOOK**

---

---

# EXERCISE — PUSH CHANGES TO FIREBASE

---

EXERCISE

## KEY OBJECTIVE

---

- › Deploy to a web host.

## TIMING

---

*5 min*

1. Make a change to the HTML, CSS, and/or JavaScript for the project you deployed to Firebase.
2. Push your changes to Firebase and verify that your updated code is what you see in your browser at `appname.firebaseio.com`

# **Exit Tickets!**

**(Class #16)**

# **LEARNING OBJECTIVES – REVIEW**

- Understand what hosting is.
- Identify a program's needs in terms of host providers.
- Ensure backward compatibility by using Babel to transpile code.
- Deploy to a web host.

# **NEXT CLASS PREVIEW**

## **Intro to React**

- Understand the roles of model, view, and controller
- Describe the difference between frameworks and libraries
- Recognize the primary uses of React
- Create a component hierarchy
- Build a React component

# **Q&A**
